Matt Fletcher Homework TODO Dr Siroj Kansakar MA244-03

$$x-y = 5$$

Problem 1.1.28. $3y+z = 11$
 $4z = 8$

Proof. Start with equation 3. Divide both sides by 4:

$$4z = 8$$

$$z = 2$$

Substitute this into the second equation:

$$3y + z = 11$$

$$3y + 2 = 11$$

$$3y = 9$$

$$y = 3$$

Substitute this into the first equation:

$$x - y = 5$$

$$x - 3 = 5$$

$$x = 2$$

$$(x, y, z) = (2, 3, 2)$$

Problem 1.1.38. $\begin{array}{rcl} 3x + 2y & = & 2 \\ 6x + 4y & = & 14 \end{array}$

Proof. By inspection, the first equation appears to be very similar to the second. Multiply the first equation by 2:

$$6x + 4y = 4$$

However, the second equation says that 6x + 4y = 14. This set of equations is inconsistent.

Problem 1.1.48. x + y + z = 2-x + 3y + 2z = 84x + y = 4

Proof. Add 4 times the first equation and the negative of the third equation.

$$3y + 4z = 4$$

Next, add the first and second equations:

$$4y + 3z = 10$$

This set of equations is easier to solve.

$$3y + 4z = 4$$
$$4y + 3z = 10$$

Add 4 times the first equation and -3 times the second.

$$\begin{array}{rcl} 12y + 16z & = & 16 \\ -12y - 9z & = & -30 \end{array}$$

Adding these, 7z = -14 and z = -2. Substitute this back into equation 2 (the unomodified one):

$$3y + (-8) = 4$$
$$y = 4$$

Substitute both of these into the original first equation:

$$x + 2 + -4 = 2$$

$$x = 0$$

Therefore, the final solution set is (x, y, z) = (0, 4, -2)

Problem 1.2.14. $\begin{bmatrix} 1 & 2 & 1 & 0 \\ 0 & 0 & 1 & -1 \\ 0 & 0 & 0 & 0 \end{bmatrix}$

Proof. This matrix represents the following set of simultaneous equations:

$$\begin{array}{rcl}
x + 2y + z & = & 0 \\
z & = & -1 \\
0 & = & 0
\end{array}$$

Substituting the value for z in the second equation into the first equation, we get a linear equation in terms of x and y.

$$x + 2y = 1$$

What this solution represents is a line in the xy-plane where every point on this line is an acceptable solution to the original matrix.

Problem 1.2.31. $\begin{array}{rcl} x-3z & = & -2 \\ 3x+y-2z & = & 5 \\ 2x+2y+z & = & 4 \end{array}$

Proof. Start by writing this as an augmented matrix: $\begin{bmatrix} 1 & 0 & -3 & -2 \\ 3 & 1 & -2 & 5 \\ 2 & 2 & 1 & 4 \end{bmatrix}$

First,
$$R_3 = R_3 + R_1$$

$$\begin{bmatrix} 1 & 0 & -3 & -2 \\ 3 & 1 & -2 & 5 \\ 3 & 2 & -2 & 2 \end{bmatrix}$$

Next, $R_3 = R_3 - R_2$
